

Argumentative essay about climate change in the Philippines

Climate change in the Philippines is becoming increasingly apparent with drastic changes to weather patterns, rising sea levels, and more extreme disasters. According to the Philippine Atmospheric, Geophysical and Astronomical Services Administration (PAGASA), temperatures have risen on average by 0.6-0.7 degrees Celsius since 1951. This increase in temperature is being attributed to the significant increase in carbon dioxide and other greenhouse gases being released into the atmosphere, which trap more heat that would otherwise be radiated out into space.

Sea levels on average have risen by 4 cm per decade since 1993, with estimates predicting this rate may increase twofold or threefold over the next century. This will result in flooding of coastal areas, as well as the displacement of people living along the coast. In addition to this, coral bleaching is becoming more and more common due to increased temperatures, further damaging the natural environment.

More extreme weather events such as typhoons and monsoons are also occurring more frequently in recent years, resulting in floods and landslides that have caused destruction of infrastructure and loss of life. The Intergovernmental Panel on Climate Change (IPCC) has predicted that these extreme weather events will become more frequent over the coming decades, further exacerbating the effects of climate change in the Philippines.

It is clear that drastic action needs to be taken to combat the effects of climate change in the Philippines. Governments must take steps to reduce the emission of greenhouse gases, and invest in renewable energy sources such as solar, wind and hydro power. In addition, increased education of the public is needed to raise awareness of the dangers posed by climate change, as well as the steps that can be taken to curb its effects.

The reality is that the effects of climate change in the Philippines are already being felt, and it is essential that action be taken as soon as possible. Only by taking positive steps to reduce emissions and invest in renewable energy sources can we hope to provide a safe and prosperous future for generations to come.

It is up to us all – individuals, businesses, and governments – to work together to combat climate change in the Philippines. We must all take responsibility for our actions and do what we can to protect our environment from further destruction. It is through these combined efforts that we can hope to minimize and eventually reverse the effects of climate change in this country, creating a better future for ourselves and our children.
