

argumentative essay on the global warming caused by humans

The global warming caused by humans is one of the most pressing issues facing the world today. There is growing evidence that human activities, such as burning fossil fuels and deforestation, are contributing to rising temperatures around the world. Scientists have estimated that if current emissions trends continue unchecked, global average temperature could rise by between 3°C and 5°C by the end of this century. This would have a devastating impact on biodiversity, sea levels, and other natural resources – potentially leading to extreme weather events and global climate disruption.

In order to address this problem, it is essential for governments around the world to take steps towards reducing emissions from human activities and transitioning to clean renewable energy sources such as solar, wind, and hydropower. Additionally, steps must be taken to protect natural resources such as forests and oceans in order to reduce the amount of carbon dioxide released into the atmosphere. It is also important to invest in research on developing technologies that can help mitigate the effects of global warming or even reverse it.

An argumentative essay on the global warming caused by humans should cover these topics in detail, examining the evidence for and against human-caused global warming. The essay should also discuss potential solutions to this problem and why they are important. Finally, the essay should provide an assessment of the state of current efforts to address climate change, as well as a discussion of what more could and should be done by governments around the world. By taking a comprehensive approach to this important issue, an argumentative essay on the global warming caused by humans can help to raise awareness and further develop solutions for tackling this pressing problem.

Ultimately, it is crucial for governments and citizens around the world to work together in order to reduce emissions and protect natural resources from further destruction. Only then can we hope to avert the worst of the consequences of global warming caused by humans.
